

Salam Anas

As part of our technical assessment, please build a **simple mini store system** using **Laravel** as the backend framework.

The Scenario

You're tasked with creating a basic store that allows:

- Admins to manage products and stock
- Customers to select a product and place an order — all within a single page

You're free to decide how to structure your models, logic, and flow. This will help us evaluate your technical thinking, attention to detail, and overall approach.

Tech Stack

- **Backend:** Laravel (required)
- **Frontend:** You may use **Blade**, **Vue.js**, **Livewire**, or any frontend stack you're most comfortable with
- **Styling:** Bootstrap, TailwindCSS, or any framework of your choice

Requirements

1. **Admin Side**
 - Ability to create and manage products, including variant combinations and stock levels
 2. **Customer Side**
 - A single-page form for customers to browse products, select options, enter details, and submit an order
 3. **Bonus**
 - Feel free to include any enhancements or features you think add value to the system
-

Submission Requirement

- Share your completed project via a **GitHub repository**
- A hosted/live version of the project.

Please share the file to aliff.rosli96@gmail.com, adisazizan@gmail.com and syahrul1414@gmail.com

Dateline : 9 August 2025 (Saturday 5 pm)

We look forward to seeing how you approach this and the decisions you make in building the system.

Best regards,
Herepay Tech Team
